

NexaLearn — Deal Strategy & Commercial Proposal

Prepared for: VP of Sales, Yuno · Prepared by: Senior Account Executive

How to read this document. Key figures and claims are tagged by origin: **[D]** dossier data · **[C]** our calculation from dossier data · **[P]** public source, listed at the end · **[H]** hypothesis to validate with NexaLearn.

Executive Summary

Recommendation: pursue NexaLearn as a Tier 1 opportunity with a "Stripe + Yuno" strategy.

- **Situation.** NexaLearn (\$89M TPV, ~2.1M transactions) will decide in six weeks whether to renew Stripe (1 August), replace it, or add a layer on top. 81% of its volume sits in markets approving only 73–81% of payments, mainly because of cross-border processing, and its homegrown router has no failover (~\$180K lost in one outage) **[D]** **[C]**.
- **Strategy.** We do not fight the renewal. NexaLearn renews Stripe on short, non-exclusive terms and keeps its discount; Yuno orchestrates on top, starting with a **free 60-day pilot in India and Nigeria**. New markets launch on Yuno from day one, and failover is live from go-live.
- **Business case [C].** On fees alone, Stripe + Yuno lands close to a Stripe-only renewal (between \$41K cheaper and \$149K more expensive) and \$154–344K below today. The value is recovered revenue: **\$1.05M (risk-adjusted) to \$3.72M (base) per year**, a net benefit vs. renewing alone of **\$0.87–3.65M per year**, with payback in **~2 months** (Yuno-led integration) or ~5.5 months in the worst case. Even risk-adjusted, it exceeds the CFO's 20% target (34% of current payments cost).
- **Pricing.** \$0.08 per transaction + 0.30% — the bottom of Yuno's range, with no discount below it — plus a 0.10% success fee per region, paid only once the uplift is proven. Risk-sharing, not a guarantee.
- **Deal structure.** Option A: free pilot, with a 24-month commitment if jointly defined success criteria are met. Option B: pilot at 50% of the fee, with a 12-month commitment. Pilot agreement signed before 1 August; go/no-go at day 90–100.
- **Path to yes.** Priya (champion) → Rajiv (technical sponsor) → Amara (business case presented by both) → Tan (signature), with an early call between Yuno's CEO or GM and Tan.
- **Critical unknowns.** Real volume and transaction count (dossier data is inconsistent), the written terms of Stripe's offer, actual PSP invoices, and onboarding with local acquirers.
- **What I need from you.** Approval of the free pilot and commitment terms (deal desk); a Solutions Engineer from week 1; an executive sponsor for the call with Tan; the Partnerships team for local acquirer onboarding.

1. Deal Qualification & Strategic Assessment

Verdict: qualified, Tier 1. NexaLearn combines quantified pain, a compelling event (PSP renewal on 1 August and Q3/Q4 expansion) **[D]** and a stack that Yuno improves without replacing. We will not fight Stripe for the renewal. We change the question from **"Stripe or Yuno?"** to **"Stripe plus Yuno"**: NexaLearn renews Stripe on short, non-exclusive terms; Yuno becomes the orchestration layer, starting with a free 60-day pilot in India and Nigeria and then extending to the other loss-making markets; new markets launch on Yuno from day one; automatic failover is live from go-live. If the pilot meets jointly agreed criteria, a pre-agreed volume commitment activates (Section 5).

Why this is a good opportunity

- **The problem is cross-border processing.** 81% of TPV (\$72M of \$89M) sits in Southeast Asia, India, Africa and LatAm, with approval rates of 73–81% vs. 86–88% in Europe and North America **[D]** **[C]**. Issuers decline foreign-acquired transactions more often; these soft declines are what local acquiring and local payment methods recover. Examples: India 14% soft declines and no UPI; Brazilian cards acquired via Stripe's US entity and no Pix; Nigerian cards declined at 29% **[D]**.
- **Revenue at stake:** 1.5–5 points of approval uplift in those four regions would recover roughly **\$2.1M (conservative) to \$3.7M (base) of gross revenue per year** **[C]** — illustrative, refined in Section 3.
- **Fragile routing:** the homegrown router has no failover, retries or A/B testing; the March Stripe outage cost ~\$180K in four hours **[D]**.

- **Expansion depends on local payment methods:** 8 new markets with no extra engineering headcount [D]. Without orchestration, each market means another PSP integration.
- **Growth pressure:** Finance is pacing toward \$103M (+16%) while the board expects 80%+ growth [D] [C]. Expansion speed is a board-level issue, not just an operational one.
- **Fit with Yuno:** the deal maps to all three value pillars — recover revenue, reduce cost, remove engineering dependency. At Yuno's standard pricing range (\$0.08–0.15/tx + 0.3–0.6%) [D], ~2.1M transactions and \$89–112M TPV represent a mid-six-figure annual contract that grows with expansion [C].

Key risks

Type	Risk	Mitigation
Technical	68% of revenue is subscriptions on Stripe Billing, with card credentials in Stripe's vault [D]. A full migration is the riskiest step.	Phase 1 leaves existing subscriptions on Stripe; only new and one-off payments in pilot markets route via Yuno. Token portability under the Stripe contract reviewed with Rajiv; token migration and network tokens in Phase 3.
Technical	Engineering capacity: Q3 product launch, slow hiring, a CTO wary of new vendors [D].	Yuno-led integration with our Solutions Engineer doing most of the work; narrow pilot scope (4 markets).
Technical	Yuno coverage of the 8 new markets (e.g. Pakistan, Bangladesh, Egypt) is not confirmed in the dossier. Coverage figures also differ: 200+ methods in 40+ countries [D] vs. 1,000+ integrations in 190+ countries on Yuno's website [P] ⁴ .	Internal coverage map by country and payment method before the proposal goes out. We commit only to what that map confirms.
Commercial	The CFO discounts approval-rate ROI and wants contractual savings [D]. Yuno's fee is added on top of acquirer fees (MDR).	Model savings from routing and local acquiring transparently; performance-linked pricing; pilot success criteria agreed upfront.
Competitive	NexaLearn signs a 12-month Stripe commit on 1 August with volume minimums or exclusivity [H], locking Yuno out.	Coach Priya to negotiate a short, non-exclusive renewal. Stripe stays as an acquirer behind Yuno, so there is no conflict.
Competitive	Stripe owns Paystack [P] ¹ , so it already controls ~88% of volume [C]. "Let us handle the rest" increases concentration risk.	Position Yuno as resilience and leverage: Stripe stays, but competes per transaction.
Deal	Stakeholders disagree on urgency ("what's another quarter?") [D].	Map the decision process in week 1; mutual action plan signed off by all four stakeholders.

Unknowns, conflicting signals and how we resolve them

Unknown / conflict	Ask	How	What we do with the answer
Volume baseline: \$89M last year vs. \$95M (Priya) vs. \$103M (Finance pacing) vs. \$112M next year; regional table sums to 2.2M transactions, not 2.1M [D] [C].	Amara	12-month transaction-level export under NDA (country, method, PSP, amount, decline code).	Model on finance actuals (\$89M); show \$103M as upside sensitivity.
Stripe's offer is verbal and its \$240K saving does not reconcile: 2.6% + \$0.25 gives ~\$297–312K on Stripe volume [C]. The dossier's "2.85% effective" is also wrong: on a \$42 ticket it is ~3.2% [C].	Priya	Ask to see the written proposal: term, volume minimums, exclusivity [H].	Like-for-like TCO for the CFO; tells us whether a short, non-exclusive renewal is realistic.
Real current fees. 2.9% + \$0.30 is Stripe's US list price; its public pricing adds +1.5%	Amara	Last 3 months of Stripe, Xendit and Paystack statements.	True cost baseline — likely above \$3.34M.

Unknown / conflict	Ask	How	What we do with the answer
for international cards and +1% for currency conversion [P] ² . Whether NexaLearn pays them is unknown [H]. The finance table also applies \$0.30 to all 2.1M transactions, not only Stripe's [C].			
Transaction mix does not add up. 68% of revenue from subscriptions at \$199–999/month allows at most ~304K transactions; 32% from courses at \$29–299 allows at most ~982K. Maximum ~1.29M transactions, not 2.1M, so a \$42 average ticket is inconsistent [C].	Amara	Transaction count and average ticket by product line (subscriptions vs. courses) in the same export.	Per-transaction fees (Stripe's \$0.30, Yuno's \$0.08) depend on it; we show a 1.29M-transaction sensitivity in Section 3.
Decline mix. "Losing 20% at checkout" [D] mixes hard declines, soft declines and successful retries. Also: is Indonesian traffic already acquired locally, as Stripe's +4% claim implies [D]?	Priya	Decline-code breakdown by market (soft vs. hard); acquirer country / BIN data from the export.	Sizes the recoverable share and sets pilot targets; if Indonesia is already local, it moves out of the pilot scope.
Urgency and decision process. Is 1 August a hard date? Who signs, on what criteria? Is the Q3 launch a hard blocker for engineering?	Priya, Rajiv	30-minute decision-mapping call with Priya; direct question to Rajiv.	Sets the pilot timeline and whether a CEO-to-CEO call is needed.
Nigeria chargebacks at 1.2% [D]. Visa's current monitoring programme (VAMP) counts fraud reports plus disputes, with a 1.5% merchant threshold from April 2026 [P] ³ . Paystack's fee threats may reflect this exposure [H].	Priya	Ask whether Paystack has issued any monitoring notice.	If yes, Nigeria becomes the first pilot market.

Prioritisation: Tier 1

For: size (\$89–112M TPV, ~2.1M transactions, 8 new markets) [D]; a compelling event (1 August renewal, 6-week decision window) [D]; quantified pain [D] [C]; direct fit — local acquiring in India, Brazil and Nigeria, where NexaLearn loses revenue [D]; access to all four decision-makers and a strong champion in Priya [D].
Against: strong incumbent, sceptical CTO, unclear urgency [D].

Downgrade to Tier 2 if: NexaLearn signs an exclusive 12-month Stripe commit, or declines to share transaction data or commit to a pilot within two weeks.

2. Stakeholder Engagement Strategy

2.1 Stakeholder map

Stakeholder	Role in decision	Priorities	Concerns	Stance today
Priya Menon , Head of Payments & Risk	Champion; builds the business case. Strong influence, no sign-off [D]	Approval rates (raised 8×); payment-method expansion; Nigeria fraud [D]	"9 months integrating for +0.4%"; burned out [D]	Positive but cautious
Rajiv Choudhury , CTO & co-founder	Technical veto; must approve [D]	Stop building payments infrastructure; 2	Vendor dependency; Yuno's age; Q3	Sceptical; "safer with Stripe or

Stakeholder	Role in decision	Priorities	Concerns	Stance today
		sprints/quarter lost [D]	bandwidth [D]	Adyen" [D]
Amara Okafor , CFO	Economic buyer; must approve [D]	Cut payment fees by 20% (~\$670K) [D] [C]	ROI hard to forecast; switching cost; payback [D]	Leading the "renew at a discount" option [D]
Tan Wei , CEO & founder	Final signature; follows the other three if they agree [D]	Growth; 8 new markets by Q4 [D]	"Payments is always the blocker" [D]	Neutral; focused on outcomes

2.2 What we sell to each stakeholder

	What we sell	Opening message	Proof	Our ask
Priya	Proof before commitment: approval uplift measured on her own traffic, plus local payment methods (UPI, Pix, M-Pesa) without engineering tickets	"Let's measure soft-decline recovery in India and Nigeria on your data before anyone signs a long contract."	Decline-code analysis of her export; pilot success criteria she co-defines; Yuno clients incl. McDonald's, Uber, Rappi [P] ⁴	Transaction export; co-ownership of pilot criteria; introduction to Rajiv
Rajiv	Payments off the roadmap: one integration replaces the homegrown router, failover from day one, new markets by configuration rather than code	"The March outage would have rerouted automatically. And your team never builds another PSP integration."	Yuno-led integration with our Solutions Engineer doing most of the work; NexaLearn keeps its own PSP contracts [H]; backed by a16z, Tiger Global, DST [P] ⁵ ; Yuno office in Singapore [P] ⁴ . As an ex-Grab engineer he knows SEA shoppers prefer wallets: cross-border cards explain Indonesia's 76% [D]	45-minute technical session; pilot scope sized to Q3 capacity; a named engineering owner
Amara	Savings she can put in a contract, and upside she only pays for if it happens	"Keep Stripe's discount, add cheaper local routes, and tie part of our fee to results."	Corrected baseline (Stripe's offer is ~3.2% effective, not 2.85%) [C]; conservative and base scenarios; performance-linked pricing (Section 3)	Last 3 months of PSP invoices; agreement on business-case method before the pilot
Tan	Expansion without payments being the blocker	"Launch your 8 new markets with one integration — not 8 new PSP projects."	Yuno offices in Dubai, Doha and Singapore [P] ⁴	Sponsor the decision timeline; confirm 1 August as the decision date

2.3 Alignment plan

- Priya (week 1): build the champion.** Analyse her transaction export and co-design the pilot. *Early win:* a recoverable-revenue map built on her own data, which becomes the core of her internal case.
- Rajiv (week 2): win the technical sponsor, with Priya in the room.** Technical deep dive with our Solutions Engineer and a pilot scoped to his Q3 capacity. *Early win:* a written integration plan with estimated engineering hours [H] and a failover design. Result: two internal sponsors — Payments & Risk and the CTO/co-founder.
- Amara (week 3): the business case, presented by Priya and Rajiv, not by Yuno alone.** She is involved from week 1 through the data request, so the method — and the pilot success criteria — are agreed before she sees any number. *Early win:* a model she can rebuild in her own spreadsheet.
- Tan (light touch in weeks 1–2; pilot sign-off end of week 3; final decision at day 90–100).** An early call from Yuno's CEO or GM sets the expansion story and the timeline, countering "what's another quarter?". The go/no-go happens with all three aligned, against criteria they defined.

Why this order: financial negotiation is where deals usually stall. We reach the CFO with two internal sponsors already behind the pilot — Payments & Risk and the CTO/co-founder — so Amara is reviewing a proposal her own leadership team supports, not a vendor pitch.

3. Commercial Proposal & Financial Impact Model

The proposal follows the strategy in Section 1: NexaLearn **keeps Stripe's discount** on the volume Stripe already does well (Europe, North America, Southeast Asian cards, existing subscriptions) and Yuno routes the loss-making markets to local acquirers and local payment methods. We therefore compare **"Stripe only"** with **"Stripe + Yuno"**, not Stripe against Yuno. The full model, with formulas and sources, is in the supporting workbook (NexaLearn_Financial_Model.xlsx). All figures are annual, USD, illustrative, on the \$89M finance baseline [D].

3.1 Pricing proposal

Component	Proposal	Rationale
Platform fee — per transaction	\$0.08	Bottom of Yuno's typical range (\$0.08–0.15) [D], justified by ~2.2M transactions (regional data). With a ~\$42 average ticket, fixed fees weigh heavily: Stripe's \$0.30 is 0.71% of the ticket, Yuno's \$0.08 is 0.19% [C].
Platform fee — % of volume	0.30%	Bottom of the typical range (0.3–0.6%) [D]. Competitive for an \$89–112M merchant without discounting below range.
Success fee	+0.10% on volume in the four loss-making regions	Paid per region only once the agreed approval-rate uplift is proven against NexaLearn's own baseline (pilot first, then each rollout market). This is risk-sharing , not a guarantee : we do not promise a number before seeing their decline data.
Held in reserve	Volume tier above \$112M TPV	Negotiation lever for the close, not offered upfront.

At full rollout this is ~\$443K/year in platform fees plus up to ~\$72K in success fees [C] — the low end of Yuno's range (~\$0.44–0.86M at list) [C]. We price competitively but do not give the technology away.

3.2 Key assumptions

Assumption	Value and justification
Approval uplift (conservative / base)	India +3 / +5 pts: 14% soft declines from 3DS friction and cross-border processing, no UPI [D]. Africa +3 / +5: Nigerian cards declined at 29% [D]. LatAm +3 / +5: Brazilian cards acquired via a US entity, no Pix or OXXO [D]. SEA +1.5 / +3: lower because Stripe claims new local acquiring in Indonesia [D]. Europe and North America: 0. All well below the 5–15 pts typical of moving to local acquiring [D]. Applied to attempted volume (approved ÷ approval rate) [C].
Risk-adjusted case	Only 50% of the conservative uplift counts towards payback [H].
Local routing cost	India 2.0% base / 2.5% conservative: Razorpay lists 2% for domestic cards and zero MDR for standard UPI [P] ⁶ . Africa 2.0% / 2.5%: Paystack lists 1.5% for local Nigerian cards vs. 3.9% international [P] ⁷ . LatAm 2.5% / 3.0%: Pix is 2% at list price [P] ⁸ . Enterprise rates are typically negotiated below list [H].
Stripe pricing under Yuno	Stripe's offer (2.6% + \$0.25) [D] applies to the volume it keeps. Whether Stripe holds that price with less volume is unconfirmed [H].
Southeast Asian wallets	No cost saving modelled: GoPay and OVO approve at 94% [D] but cost 5.0–5.5% for digital merchants at list [P] ⁹ , more than cards. Routing to wallets raises revenue, not savings.
Operations	Routing-layer maintenance of \$60K eliminated [D]; 70% of the \$85K manual recovery labour automated through retries [D] [H]. Processing cost on recovered revenue: 3% all-in [H].
Switching cost	\$150K for a Yuno-led, phased integration [H]; \$400K worst case, Amara's estimate [D].

3.3 Total cost of ownership: three scenarios

Annual, \$	Current state	Stripe offer (renew only)	Stripe + Yuno (conservative)	Stripe + Yuno (base)
PSP fees (MDR)	3,292,500	2,989,300	2,742,800	2,553,300
Yuno platform fee	–	–	443,000	443,000
Yuno success fee (if uplift met)	–	–	71,900	71,900
Routing maintenance + manual recovery	145,000	145,000	25,500	25,500
Total payments TCO	3,437,500	3,134,300	3,283,200	3,093,700
Δ vs. current state	–	(303,200)	(154,300)	(343,800)
Δ vs. Stripe offer	–	–	+148,900	(40,600)
Effective PSP + Yuno rate on TPV	3.70%	3.36%	3.66%	3.45%

Current state is built bottom-up from the regional data (\$3.44M) [C]; finance reports \$3.34M [D] because it applies the \$0.30 fee to all 2.1M transactions. Actual invoices may be higher still if Stripe's international-card (+1.5%) and currency-conversion (+1%) surcharges apply [P]² [H].

Honest reading for the CFO: on fees alone, Stripe + Yuno saves \$154–344K against today and lands close to Stripe's renewal (between \$41K cheaper and \$149K more expensive). The decision is not won on fees; it is won on revenue that Stripe alone cannot recover.

3.4 Revenue recovered from approval-rate uplift

Region	Approved volume	Approval rate	Conservative	Base	Risk-adjusted
Southeast Asia	\$34.0M	81%	\$630K	\$1,259K	\$315K
India	\$18.0M	79%	\$684K	\$1,139K	\$342K
Africa	\$8.9M	73%	\$366K	\$610K	\$183K
Latin America	\$11.0M	77%	\$429K	\$714K	\$214K
Total (gross)	\$71.9M		\$2.11M	\$3.72M	\$1.05M

3.5 Net benefit and payback

Annual, \$	Risk-adjusted	Conservative	Base
Net revenue recovered (after processing cost)	1,022,137	2,044,274	3,610,703
TCO difference vs. Stripe offer (+ = saving)	(148,900)	(148,900)	+40,600
Net annual benefit vs. Stripe offer	873,237	1,895,374	3,651,303
Net annual benefit vs. current state	1,176,437 (34% of TCO)	2,198,574 (64%)	3,954,503 (115%)
Payback — Yuno-led switching (\$150K)	2.1 months	0.9 months	0.5 months
Payback — worst case (\$400K)	5.5 months	2.5 months	1.3 months

Even counting only half of the conservative uplift, NexaLearn exceeds Amara's 20% target (34% of current payments TCO) and pays back the worst-case switching cost in under 6 months [C]. Sensitivities: with 1.29M transactions instead of 2.2M, the risk-adjusted benefit vs. Stripe is ~\$870K; at \$103M TPV it is ~\$990K [C].

Not modelled (upside): lower Nigerian chargebacks (1.2%) [D]; avoided outage losses (~\$180K in the March incident) [D]; faster launch of 8 new markets; and the negotiating leverage of routing Stripe volume per transaction at the next renewal.

4. Objection Handling

Principle: we never promise what we cannot prove. Every answer relies on NexaLearn's own data, public evidence or a contractual mechanism — and on what Yuno customers say publicly, not on guarantees. Customer results below are as published in Yuno's case studies (vendor-reported, mostly LatAm); we present them as their experience, not as a forecast for NexaLearn.

A — Rajiv (CTO): "You're a 4-year-old startup... what if Yuno goes down or out of business?"

Acknowledge. The right question from the person who lived the March outage and is paged when payments fail.

Substance. Yuno does not replace Stripe: Stripe stays connected underneath and NexaLearn keeps its own acquirer contracts [H]. Yuno is a PCI DSS Level 1 provider with a documented process to export card tokens to another PCI-certified provider — the exit path is written down before signing [P]^{10 11}. Backed by a16z, Tiger Global and DST [P]⁵, with an office in Singapore [P]⁴. Uptime commitments and service credits go into the contract [H].

Customer voice. Rappi runs 20+ payment providers through Yuno; adding a provider no longer takes months of development, and payment-issue detection went from 5–10 minutes to milliseconds [P]¹².

Reframe. The concentration risk today is not Yuno; it is one provider. Stripe handles 78% of volume and owns Paystack [P]¹, so ~88% of payments depend on one group [C]. The March outage cost ~\$180K in four hours because nothing failed over [D]. Orchestration reduces vendor dependency; it does not add to it.

Tie-back. Rajiv stops building and maintaining payments infrastructure — the goal he set himself.

B — Amara (CFO): "Stripe offers 10% off with zero switching cost... what's the payback, and what if the uplift doesn't happen?"

Acknowledge. Stripe's offer is a clean, low-risk number, and protecting the board's profitability target is your job.

Substance. You don't have to choose: renew Stripe on short, non-exclusive terms and keep the discount; Yuno sits on top and takes only the volume Stripe struggles with. Risk-adjusted (half our conservative case), the net benefit vs. renewing alone is ~\$873K a year; payback ~2 months with a Yuno-led integration, ~5.5 months even at your \$400K estimate [C]. Existing subscriptions stay on Stripe — no big-bang migration.

De-risk. If the uplift is zero, our success fee is not paid and the extra cost over renewing alone is capped at ~\$77K a year [C]. The pilot has exit criteria agreed with you before day one.

Customer voice. Open English, an online education company like NexaLearn: "By enhancing our payment processing, we have increased our approval rates and reduced costs." — Wilmer Sarmiento, Co-Founder [P]¹³.

Tie-back. Every number is in a workbook you can rebuild with your own assumptions.

C — Priya (Head of Payments): "They all promise smart routing and +0.5%... Can you guarantee 3 points?"

Acknowledge. You've been through that, and you are the one who must defend the result internally.

Substance. We won't guarantee 3 points — nobody can honestly do so before seeing your decline codes. What makes this case different from a generic smart-routing pitch is that NexaLearn's losses come from a cause orchestration addresses directly: cross-border processing. Indian cards show 14% soft declines, Brazilian cards are acquired through a US entity, Nigerian cards are declined at 29% [D]. Moving to local acquiring typically adds 5–15 points [D]; our model assumes only 1.5–5 [C].

Customer voice. inDrive splits volume between providers and compares cost and approval rates, reaching "an approval rate of around 90%" — Vasilyi Everstov, Head of FinTech [P]¹⁴. Livelo reports +5% approval and 50% of failed transactions recovered [P]¹⁵ — relevant while NexaLearn still recovers failed renewals by email.

Prove it, don't promise it. A 60-day pilot on part of your India and Nigeria traffic, measured by decline code against a Stripe control group — narrow scope, not a 6-month integration. The pilot is free of charge (Section 5), and our success fee applies only once the agreed uplift is proven.

Tie-back. Board-ready evidence for your business case, without hiring engineers.

D — Rajiv (CTO): "My team is slammed with the Q3 launch... can this wait until Q4 or Q1?"

Acknowledge. The Q3 launch comes first, and slow hiring makes every sprint precious.

Substance. The integration is led by Yuno, with our Solutions Engineer doing the heavy lifting. Phase 1 is one integration for new and one-off payments in India and Nigeria; existing subscriptions are untouched. Effort to be estimated by our Solutions Engineer [H] and planned around your launch freeze.

Customer voice. inDrive launched in 10 new countries in under eight months through a single API [P]¹⁴.

Reframe. Waiting is not free: each quarter of delay leaves ~\$220K of risk-adjusted net benefit on the table [C]; 1 August means signing Stripe on its terms for 12 months; and the 8 new markets in Q4 would each need a new PSP integration — exactly the sprints you want to stop spending.

Tie-back. Starting now is the option that costs your team the fewest sprints.

Customer references

The strongest proof is a peer who was in NexaLearn's position. We will propose reference conversations — Open English for Amara and Priya, Rappi or inDrive for Rajiv — coordinated with Yuno's Account Management team and only if those customers wish and are available. Their time and confidentiality come first, so nothing is promised until they agree. Where a Yuno customer event or roundtable takes place during the sales cycle [H], we will invite NexaLearn's team so they can speak with peers in an informal setting.

5. 90-Day Deal Plan

5.1 Deal structure: prove first, commit if it works

We do not ask NexaLearn to choose a vendor in six weeks. We ask them to decide to **run a pilot**, renew Stripe on short, non-exclusive terms, and **agree upfront what success means and what happens next**. Yuno invests in the pilot because we are confident in the result; in return, NexaLearn commits to build with us if it works.

Phase	Scope	Why
1. Pilot (days 30–90)	New and one-off payments in India and Nigeria routed to local acquirers and local payment methods; a share of traffic stays on Stripe/Paystack as a control group [H]. Failover live from go-live.	Largest soft-decline and chargeback problems [D]; Yuno has direct local acquirers there [D]. Narrow scope fits Rajiv's Q3 capacity.
2. Rollout (months 4–6)	Brazil (Pix) and Mexico (OXXO), Indonesia, and the 8 new markets launched on Yuno from day one .	Indonesia goes after the pilot, once Stripe's local-acquiring claim is tested with data.
3. Full orchestration (months 6–12)	Subscriptions and token migration (network tokens); Stripe stays as one acquirer behind Yuno.	Highest-risk step, done last, once trust is established.

5.2 Pilot terms: two options

	Option A — recommended	Option B
Pilot fee	Free — Yuno invests	50% of platform fee (~\$5K) [C]
Commitment if the pilot succeeds	24 months ; all volume in the four loss-making regions (SEA, India, Africa, LatAm) plus the new markets routed through Yuno [H]	12 months ; pilot markets only (India and Nigeria) [H]
Pricing	Locked at \$0.08 + 0.30% for 24 months; volume tier available above \$112M TPV	Locked for 12 months; no volume tier
If the pilot fails	Clean exit in both options: no commitment, no success fee, traffic returns to Stripe/Paystack	

For context, the pilot's full platform fee would be ~\$10K (60 days, ~\$2.2M volume, ~44K transactions, half of India and Africa traffic) [C] [H]. The real difference between the options is the commitment, not the pilot price — Option A is the better deal for both sides.

Success criteria — defined jointly with Priya, Rajiv and Amara in weeks 2–3 (our starting proposal): approval uplift at least equal to our conservative case (India +3 pts, Nigeria +3 pts) vs. the control group, measured by decline code; fraud and chargeback rates no worse than control; cost per approved transaction no higher than control; uptime and latency within agreed levels; a minimum sample size so we never decide on noise **[H]**. All three sign off the result.

Outcome at day 90	Decision (days 90–100)	Implementation
Success	Commitment activates automatically — terms already negotiated during the pilot	Phase 2 kick-off around day 100; rollout in months 4–6; Phase 3 in months 6–12
Partial success	Roll out where criteria are met	30-day extension in the remaining market, then a final decision
Failure	No commitment, no success fee	Traffic returns to Stripe/Paystack within ~2 weeks; NexaLearn keeps its token-export rights [P] ¹¹

5.3 Timeline

When	Milestones	Exit criterion
Week 1 · Discover	Decision-mapping call with Priya; NDA and transaction export; invoice request to Amara; Yuno CEO/GM call with Tan; Solutions Engineer analyses decline codes	Recoverable-revenue map; decision process documented
Weeks 2–3 · Co-design	Technical deep dive with Rajiv; success criteria agreed with the three stakeholders; security pack (PCI DSS, token-export clause) to Legal; local acquirer onboarding starts; reference calls if customers agree	Pilot agreement signed (Option A or B), including the commitment terms
Days 22–30 · Build	Yuno-led integration for India and Nigeria; failover configured	Go-live around day 30 [H]
By 1 August (~day 42)	NexaLearn renews Stripe on short, non-exclusive terms	Room for Yuno preserved
Days 30–90 · Prove	60-day pilot; weekly dashboards with Priya; checkpoint at day 60; master agreement finalised in parallel so nothing is renegotiated later	Final readout at day 90
Days 90–100 · Decide	Go/no-go with Priya, Rajiv and Amara, signed by Tan	Commitment activated, extended or closed

5.4 Resources

Solutions Engineer from week 1 (decline-code analysis, technical deep dive, leads the integration). **Yuno executive sponsor** (CEO/GM) in weeks 1–2 and at the day 90–100 go/no-go, as Tan's peer. **Deal desk** in week 2 to approve the free pilot and commitment terms. **Customer references** in weeks 2–3 via Account Management, only if customers agree. **Legal** in weeks 2–3 (pilot agreement, data-processing agreement, security pack) and days 30–90 (master agreement). **Partnerships** from week 2 for local acquirer onboarding in India and Nigeria **[H]**. **Account Management** from day 30 to run the pilot and the Phase 2 handover. **Marketing** in weeks 2–6 for case studies and a customer event invitation, if one is planned **[H]**.

5.5 Competitive strategy against Stripe

1. **Don't fight the renewal; absorb it.** "Stripe + Yuno" makes Stripe's discount part of our case.
2. **Answer "zero switching cost" with "zero cost to prove it".** The free pilot removes the financial risk of trying Yuno.
3. **Win the timing.** Pilot agreement signed before 1 August, so the Stripe renewal can be short and non-exclusive. Priya asks Stripe for its written proposal (term, volume minimums, exclusivity).
4. **Compete on data, not claims.** The pilot runs against a Stripe control group where cross-border processing hurts most. We test Stripe's Indonesia claim instead of disputing it.
5. **A price war helps us.** Stripe sits underneath Yuno, so any further Stripe discount also lowers our scenario's cost **[C]**.

6. **Never disparage Stripe.** It remains a valued acquirer in the stack; the conversation is about dependency and resilience (~88% of volume with one group) [C].

5.6 Risks and mitigation

Risk	Mitigation
Rajiv slow-walks because of engineering bandwidth	Yuno-led integration, minimal Phase 1 scope, plan built around his launch freeze; Tan sets priority after the executive call
Go-live slips beyond day 30	Keep the full 60-day measurement window and move the readout, rather than shortening the pilot
Amara rejects the ROI	Risk-adjusted case, editable workbook, downside capped at ~\$77K/year, free pilot and success fee only if proven [C]
NexaLearn uses the free pilot without real intent to commit	Commitment terms signed with the pilot agreement; success criteria co-defined and signed off by all three stakeholders
Stripe drops its price or bundles Radar and Billing	Any Stripe discount flows into Stripe + Yuno; we keep competing on recovered revenue
NexaLearn signs a Stripe exclusivity or volume minimum	Negotiate carve-outs for local payment methods and new markets; if impossible, downgrade to Tier 2 and pursue the new markets
Local acquirer onboarding delays (verification, local-entity requirements)	Start in week 2 in parallel; Partnerships engaged early [H]
Champion fatigue (Priya is "slightly burned out" [D])	We do the heavy lifting: data analysis, business-case material, board-ready summary
